

The following comparison extends the three-family table to the five standard families, recording the number of distinct r -matrix sectors, the entanglement discriminant c_0 , and the leading Eisenstein weight appearing in the τ -dependent corrections.

Family	Sectors	c_0	Entangled?	Lead Eisenstein wt
$\mathcal{H}_k$	1	0	No	4 (G_4)
$V_k(\mathfrak{sl}_2)$	2	$\Omega_{\mathfrak{sl}_2}$	Yes	4 (G_4)
Vir_c	3	∂T	Yes	4 (G_4)
$\mathcal{W}_3(c)$	5	$(\beta^2/2)\partial\Lambda + \dots$	Yes	6 (G_6)
$\beta\gamma$	1	1	Yes	2 (G_2)
